PROFESSIONAL SUMMARY

Final-year Software Engineering student at Universiti Malaysia Terengganu (Dean's List ×3) who has independently designed, built, and deployed full-stack web applications to production. Specialises in Java/Spring Boot backend architecture, RESTful API design, and relational database modelling. Applies software engineering best practices, layered architecture, RBAC, normalized schemas and unit testing to ship maintainable systems. Actively targeting a backend or full-stack internship to grow through exposure to enterprise-scale engineering.

TECHNICAL SKILLS

Languages: Java (Primary) · JavaScript · Python · SQL

Backend Frameworks: Spring Boot · Spring Data JPA (Hibernate ORM) · Node.js · Express.js · FastAPI · JSP & Servlets

Frontend: React · Thymeleaf · Vanilla JS · HTML5 · CSS3

Databases: MySQL · 3NF Schema Design · JDBC · TiDB (Cloud)

APIs & Integrations: RESTful API Design · OpenWeather API · Cloudinary · Leaflet.js · Postman

DevOps & Tools: Docker · Git · GitHub · Maven · Render (Deployment) · JUnit

Architecture: Layered Architecture (Controller–Service–Repository) · MVC · RBAC · ERD

PROJECTS — ALL LIVE · AHSMART.DEV

UMT Campus Marketplace Platform · *Spring Boot · Spring Data JPA · Thymeleaf · MySQL · Cloudinary · Docker · Render + TiDB*

Final-year project. Solo-built, end-to-end student marketplace replacing unstructured WhatsApp trading groups with verified sellers, full order lifecycle, and in-app chat.

- Engineered a 3-role RBAC system (Buyer · Seller · Admin), including an admin-controlled seller verification workflow to prevent fraudulent listings.
- Built a fully normalized 3NF MySQL schema (13 entities: users, sellers, listings, cart, orders, payments) with strict integrity constraints eliminating data redundancy.
- Implemented a complete e-commerce flow: product listings, cart management, order tracking, payment records, and real-time buyer–seller chat.
- Integrated Cloudinary for cloud-based media management and Deployed to Render (app) + TiDB (cloud database).

Attendance Management System · *Java · JSP · Servlets · MySQL · Maven · Docker · Render*

Solo-built QR-code web app enabling lecturers to automate and track student attendance with role-based workflows for lecturers, students, and admins.

- Engineered time-limited QR code generation per session, preventing attendance fraud by automatically invalidating codes outside the active window.
- Built MVC architecture (JSP/Servlet) with a normalized relational schema and duplicate-prevention validation, ensuring accurate attendance records. Containerized with Docker and deployed live to Render.

WanderLite — Smart Tourism Dashboard · *Node.js · Express.js · Vanilla JS · Leaflet.js · OpenWeather API · Render*

Real-time tourism dashboard unifying weather, currency exchange, and geo-based attraction discovery in a single interactive interface.

- Unified 3 external API data sources (weather, currency, attractions) into a single seamless UX, reducing the need for users to switch between platforms.
- Integrated Leaflet.js interactive map with category-based attraction discovery, enabling real-time geographic exploration.
- Implemented a fallback data provider strategy to improve attraction lookup reliability a software resilience pattern ensuring consistent UX under API failures.
- Deployed live to Render, demonstrating Node.js server management and production deployment skills.
